Experiment 3

Student Name: Ankit Kushwaha **UID: 23BCS14105**

Branch: CSE **Section/Group: 23BCS_KRG-1/A**

Semester: 5 **Date of Performance:21/08/25**

Subject Name: Advanced Database and Management System **Subject Code: 23CSP-333**

1. Aim:

[EASY] Generate an Employee relation with only one attribute i.e, Emp_ID. Then, find the maximum Emp_ID, but excluding the duplicates.

[MEDIUM] Create Two Tables. Department (ID, name) and Employees (ID, name, Salary, deptID). Then output the highest earners from each department.

[HARD] Create two tables A and B with the attributes (EmpID, EmpName, Salary) and output the lowest salary of each employee across the two tables.

2. Tools Used: SQL Server Management Studio

3. Code:

```
-- EASY

CREATE TABLE TBL_EMPLOYEE (
 EMP_ID INT
);

INSERT INTO TBL_EMPLOYEE
VALUES
(2), (4), (4), (6), (6), (7), (8), (8);

SELECT * FROM TBL_EMPLOYEE;

SELECT MAX(EMP_ID)
FROM TBL_EMPLOYEE
```

```
WHERE EMP_ID IN
(SELECT EMP_ID FROM TBL_EMPLOYEE GROUP BY EMP_ID HAVING
COUNT(EMP_ID) = 1);

---------- MEDIUM --------------

CREATE TABLE department (
id INT PRIMARY KEY,
dept_name VARCHAR(50)
);

-- Create Employee Table
CREATE TABLE employee (
id INT,     name
VARCHAR(50),     salary
INT,     department_id
INT,
    FOREIGN KEY (department_id) REFERENCES department(id)
);

-- Insert into Department Table
INSERT INTO department (id, dept_name) VALUES
(1, 'IT'),
(2, 'SALES');

-- Insert into Employee Table
INSERT INTO employee (id, name, salary, department_id)
VALUES
(1, 'JOE', 70000, 1),
(2, 'JIM', 90000, 1),
(3, 'HENRY', 80000, 2),
(4, 'SAM', 60000, 2),
(5, 'MAX', 90000, 1);

Select d.dept_name, e.name, e.salary
from employee as e inner join
department d on e.department_id =
d.id where e.salary in  (select
max(salary) from employee group by
department_id);
```

```
-- or

Select e.name, d.dept_name, e.salary
from employee as e inner join
department d on e.department_id =
d.id where e.salary in  (Select
max(salary) from
employee where department_id = e.department_id) order
by d.dept_name;

-- HARD: GIVEN TWO TABLES OUTPUT THEM AS FOLLOWS:

CREATE TABLE TBL_A (
 EMP_ID INT PRIMARY KEY,
 E_NAME VARCHAR(20),
 SALARY INT
);

CREATE TABLE TBL_B (
 EMP_ID INT PRIMARY KEY,
 E_NAME VARCHAR(20),
 SALARY INT
);

INSERT INTO TBL_A
VALUES
 (1, 'AA', 1000),
 (2, 'BB', 300);

INSERT INTO TBL_B
VALUES
 (2, 'BB', 400),
 (3, 'CC', 100);

/*
OUTPUT-
EMP_ID E_NAME SALARY
```

```
1       AA      1000
2       BB      300 (MIN)
3       CC      100
*/

SELECT EMP_ID, E_NAME, MIN(SALARY)
FROM(
SELECT * FROM TBL_A AS A
UNION ALL
SELECT * FROM TBL_B AS B
) AS RES
GROUP BY EMP_ID, E_NAME;
```

4. Output:

[EASY]

	EMP_ID
1	2
2	4
3	4
4	6
5	6
6	7
7	8
8	8

	(No column name)
1	7

[MEDIUM]

	dept_name	name	salary
1	IT	JIM	90000
2	IT	MAX	90000
3	SALES	HENRY	80000

[HARD]

	EMP_ID	E_NAME	(No column name)
1	1	AA	1000
2	2	BB	300
3	3	CC	100

5. Learning Outcomes:

- Understand the role of subqueries in simplifying complex SQL operations.
- Apply sub-queries in SELECT, WHERE, FROM clauses to retrieve specific data.
- Utilize sub-queries for filtering, aggregation, and conditional logic.
- Analyze query performance implications when using sub-queries versus joins.
